

Reagents for Complement Fixation Tests

SERION CFT

A classical, standardized method for your daily laboratory routine

The Complement Fixation Test (CFT) is a serological method to detect antibodies against pathogens in accordance with the KOLMER technique, World Health Organization (WHO) guidelines as well as the National Health Service (NHS, Great Britain and Northern Ireland).

- **Cost-effective due to standardized reagents**
- **Lyophilized antigens, control antigens as well as positive and negative control sera simplify the storage**
- **Suitable screening test to identify acute infections**
- **Compensation of seroprevalences allow high specificity**
